J) Read this passage and answer the questions.

The Wright brothers read everything about balloons and flying machines. They also read about people who tried to fly on gliders (planes with wings, but no motors). Then the Wright brothers began to design their own flying machine. They used many ideas and developed **them** by different experiments.

Soon, They needed a place to test their ideas about flight. They found a suitable place. There was a big field near the sea. It had the right wind and open space all the time.

They tested more than two hundred designs of wings. These tests gave them the correct information about flight. Now it was possible for them to design a machine that could fly.

The Wright brothers built a glider. They made almost one thousand flights with the glider. This glider showed that they solved most of the problems of balance in flight. By the autumn of nineteen- oh three, Wilbur and Orville designed and built an airplane powered by a gasoline engine.
